

# MANUAL

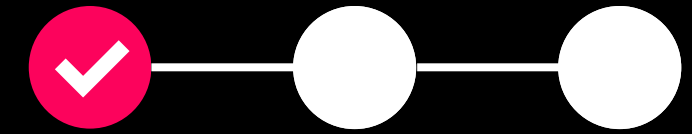

Everything you need to know to get the music system  
into your project and working in less than **15 minutes**

PART 1

QUICK

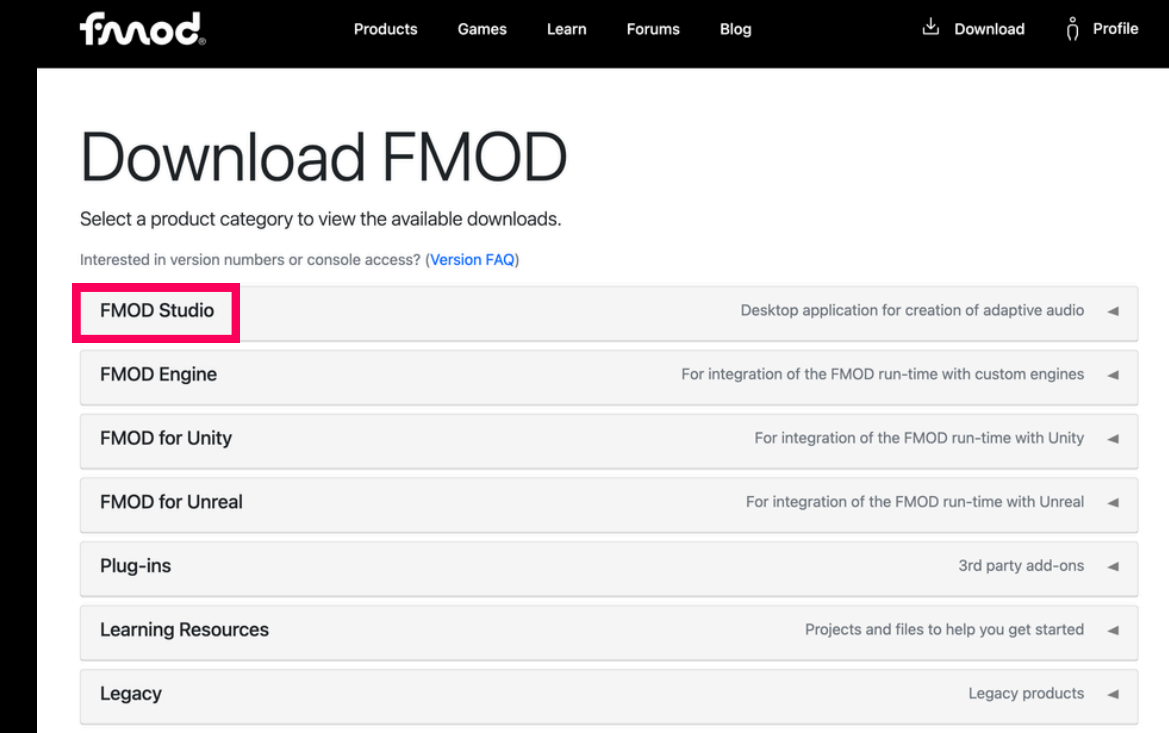

SETUP (in 3 steps)

# 1) DOWNLOAD FMOD

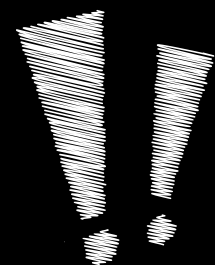

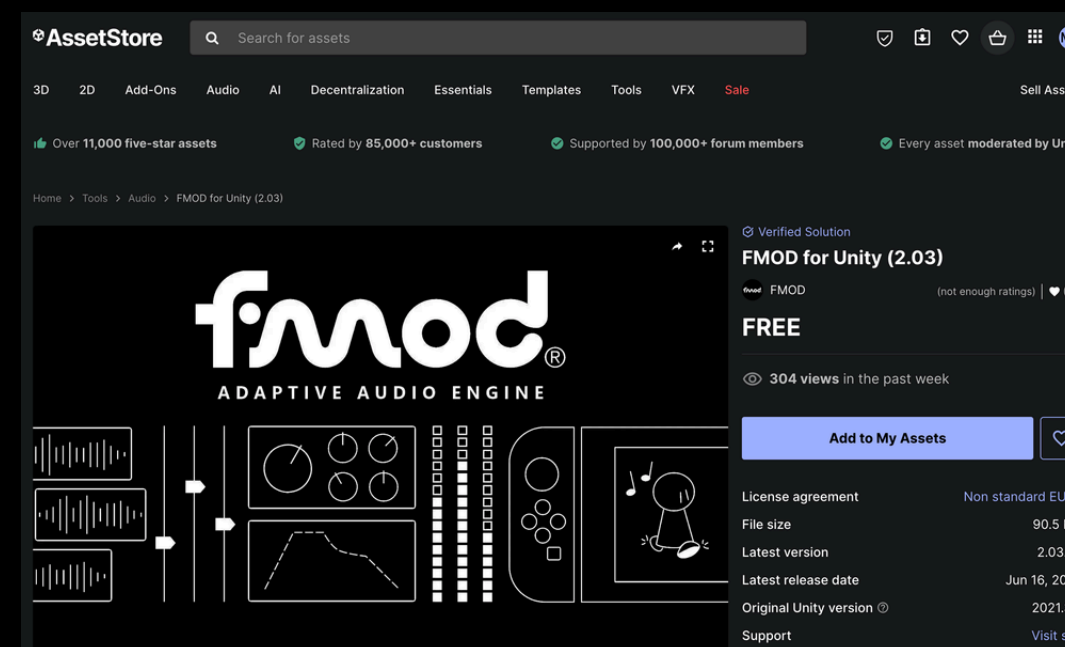

- Download and install **FMOD Studio 2.03** (you'll need to create an account first)

<https://www.fmod.com/download#fmodstudio>

- Find **FMOD for Unity (2.03)** at the link below and add to your assets

<https://assetstore.unity.com/packages/tools/audio/fmod-for-unity-2-03-311497>

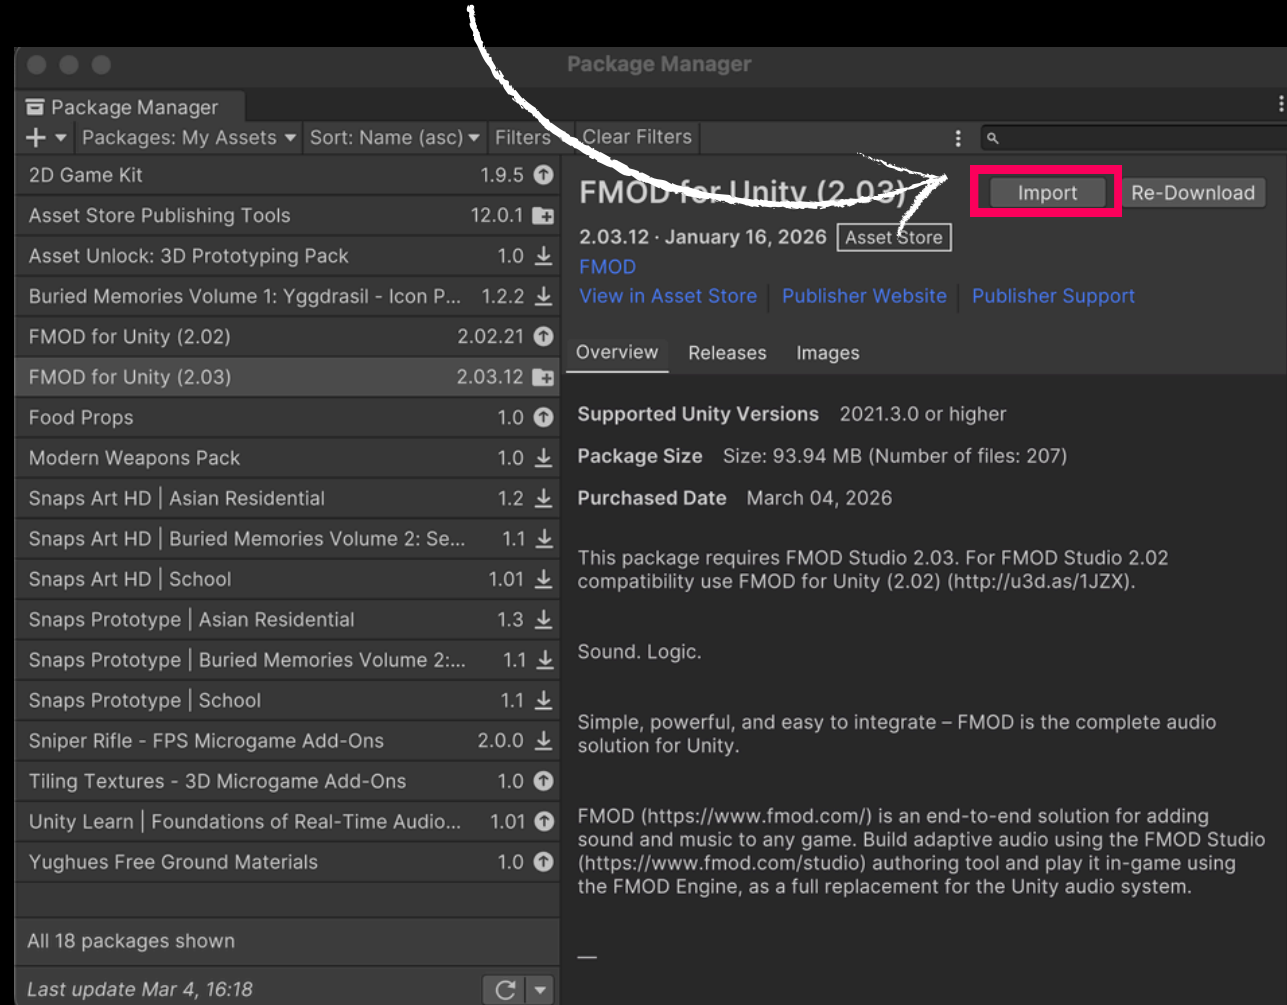

Make sure to use the right version! (2.03)

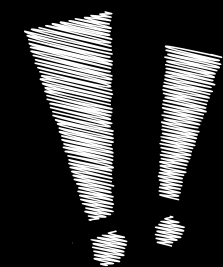

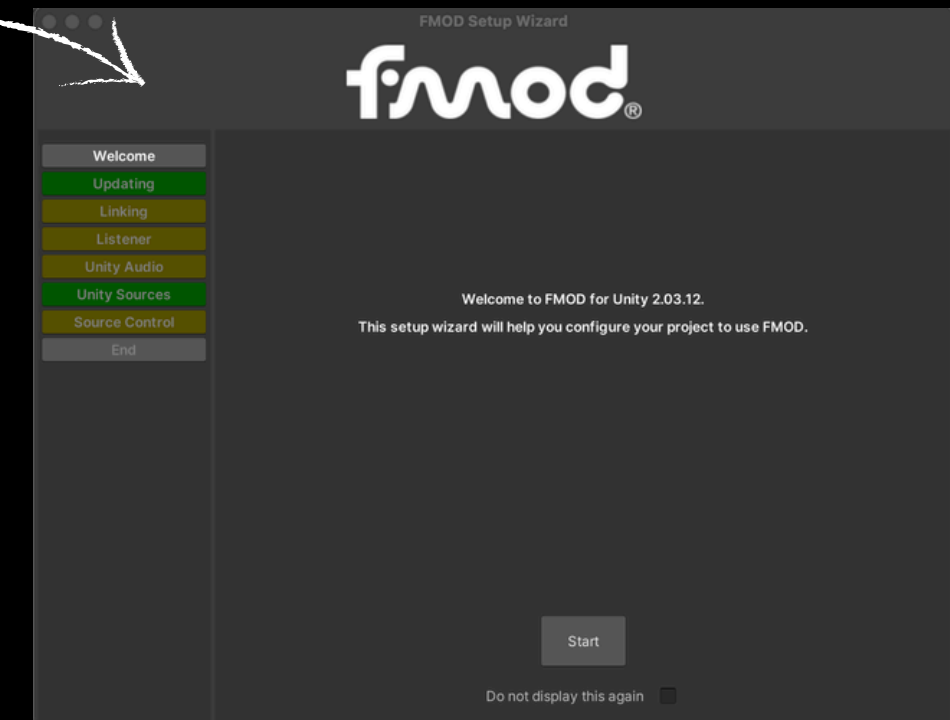

## 2) CONNECT FMOD TO UNITY

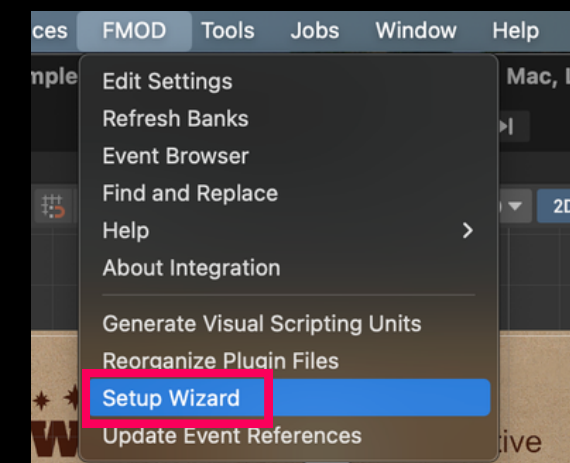

Import the **FMOD for Unity (2.03)** asset into your unity project

The **FMOD setup wizard** should then pop up

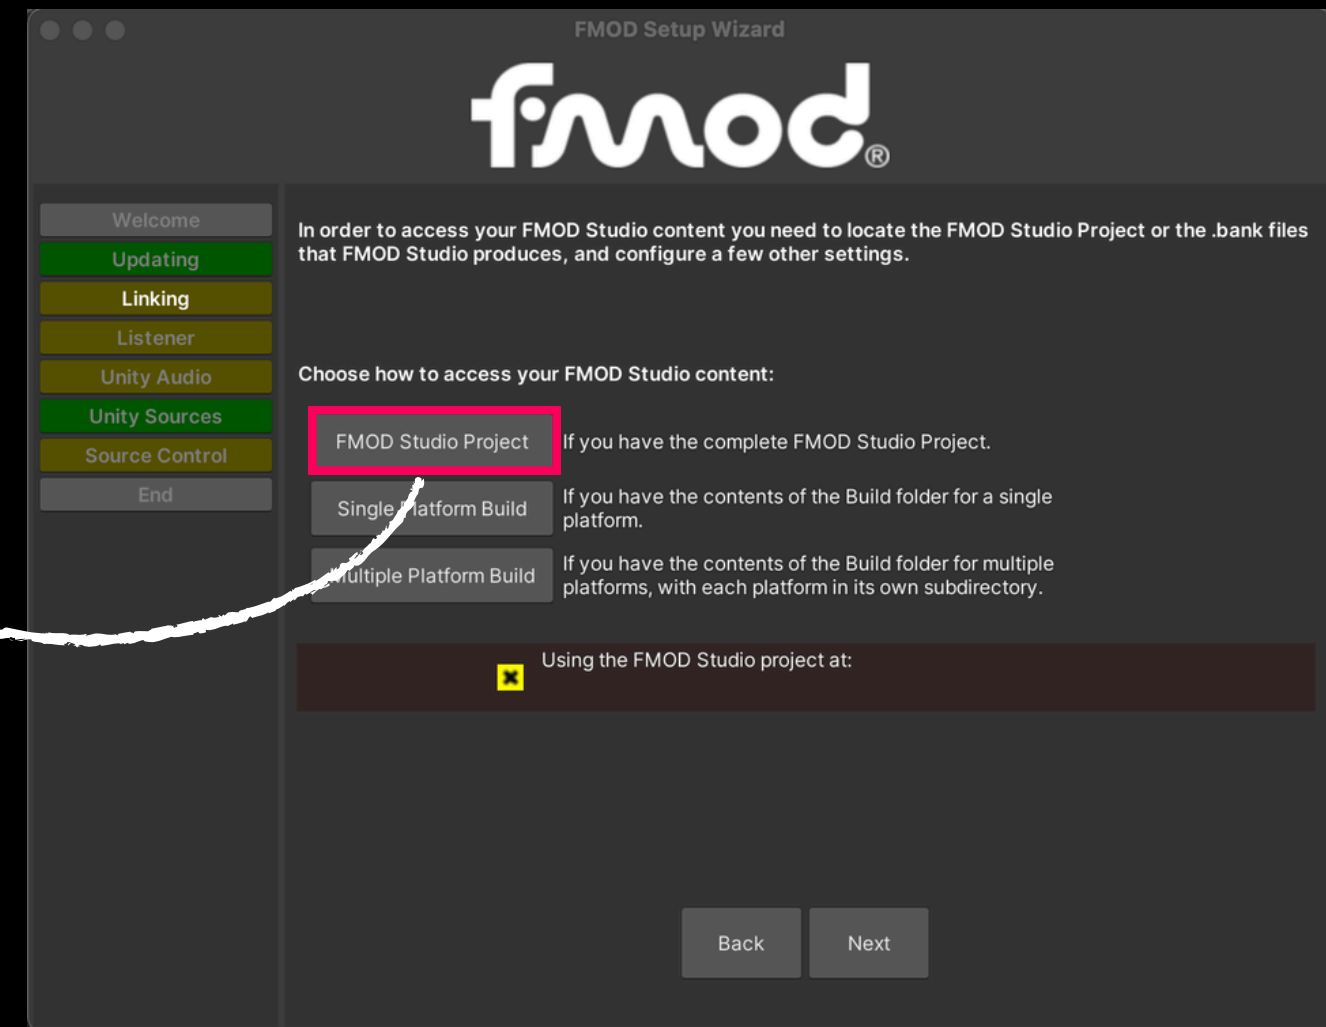

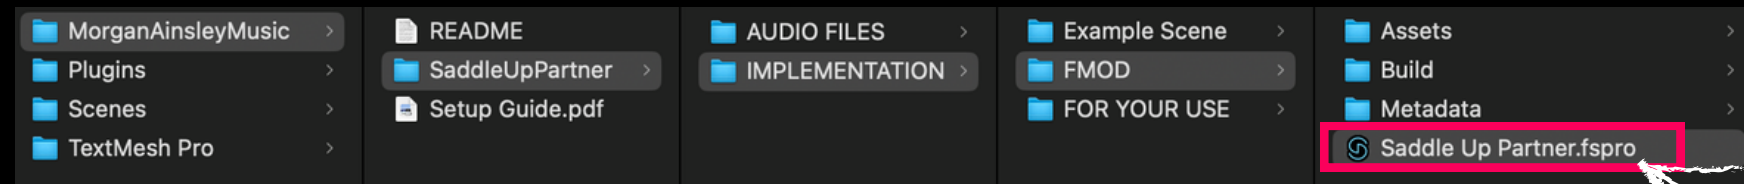

If the FMOD Setup Wizard doesn't pop up, you can always open it from the FMOD menu in the menu bar

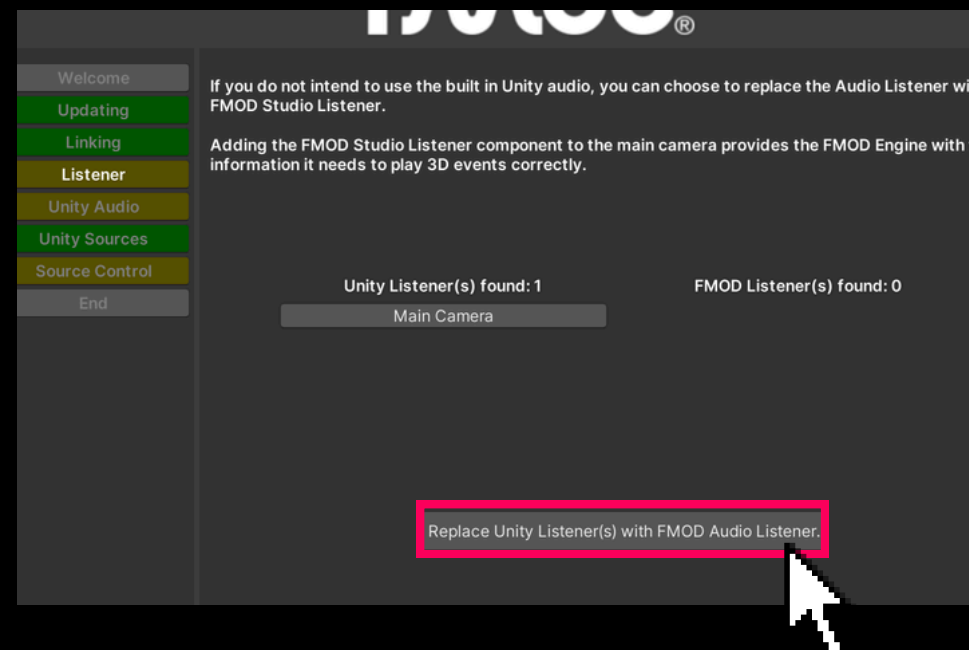

Follow the steps in the setup wizard, including the following:

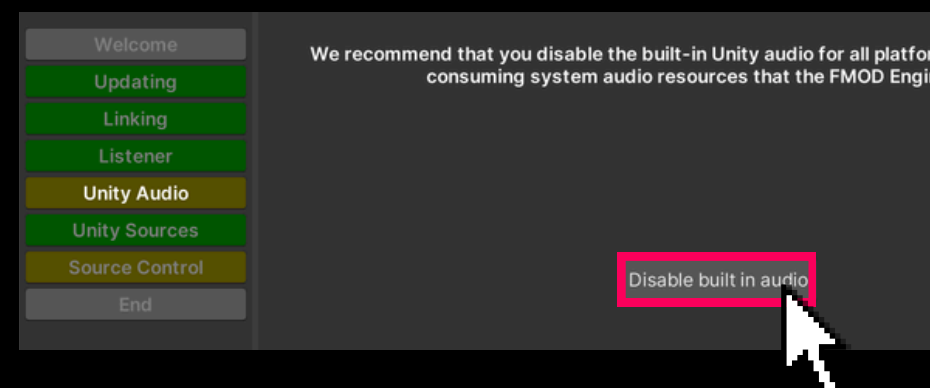

- Link the **FMOD Studio Project** called **Saddle Up Partner.fspro** (located in the file structure of this asset pack as shown below)

- Replace the **Unity Listener** with the **FMOD Listener**

- Disable Unity's **built in audio** (so that FMOD can manage it)

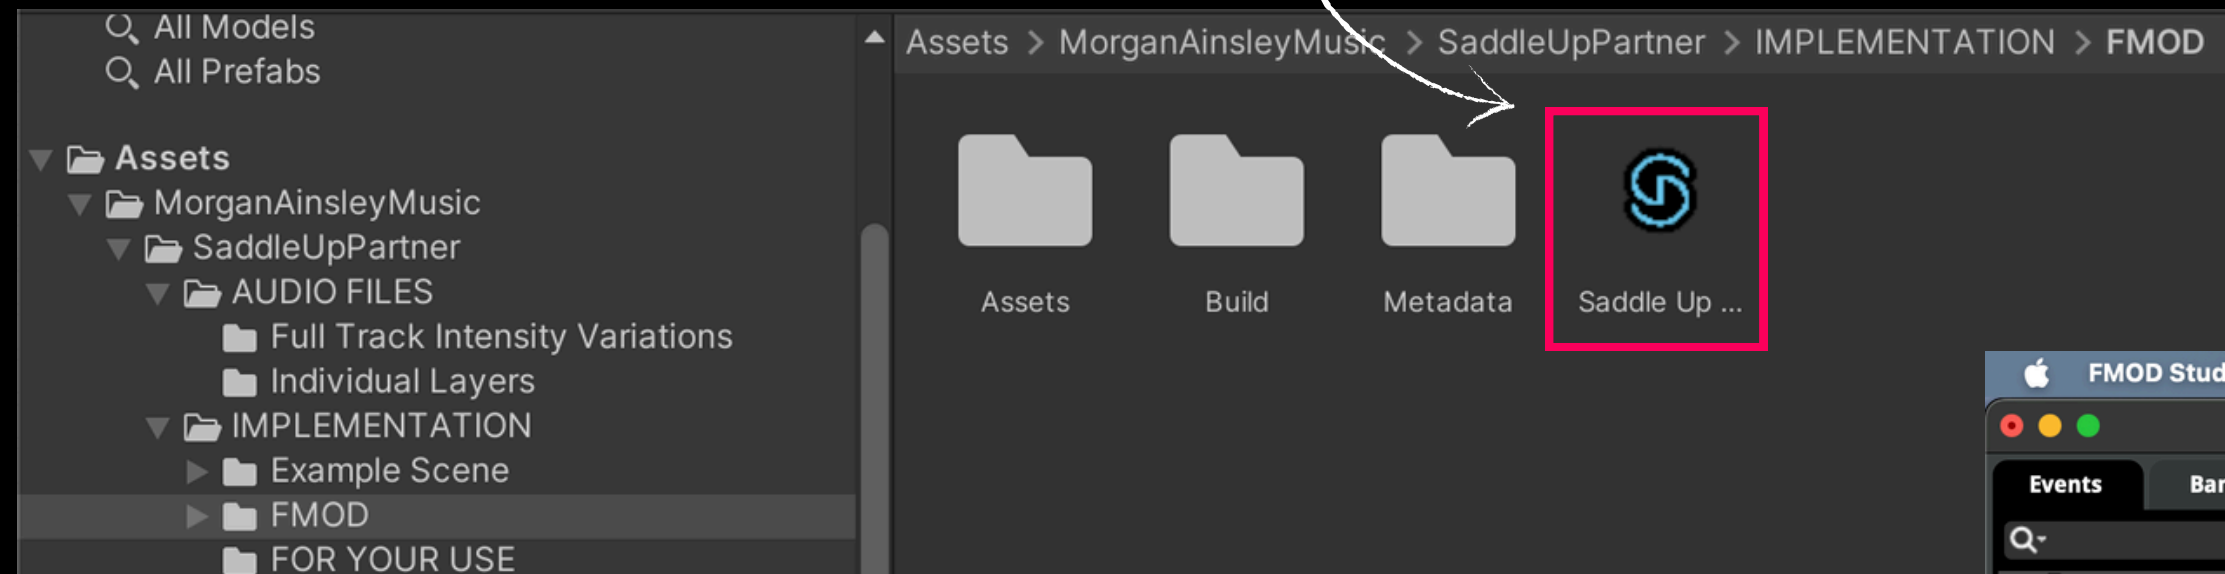

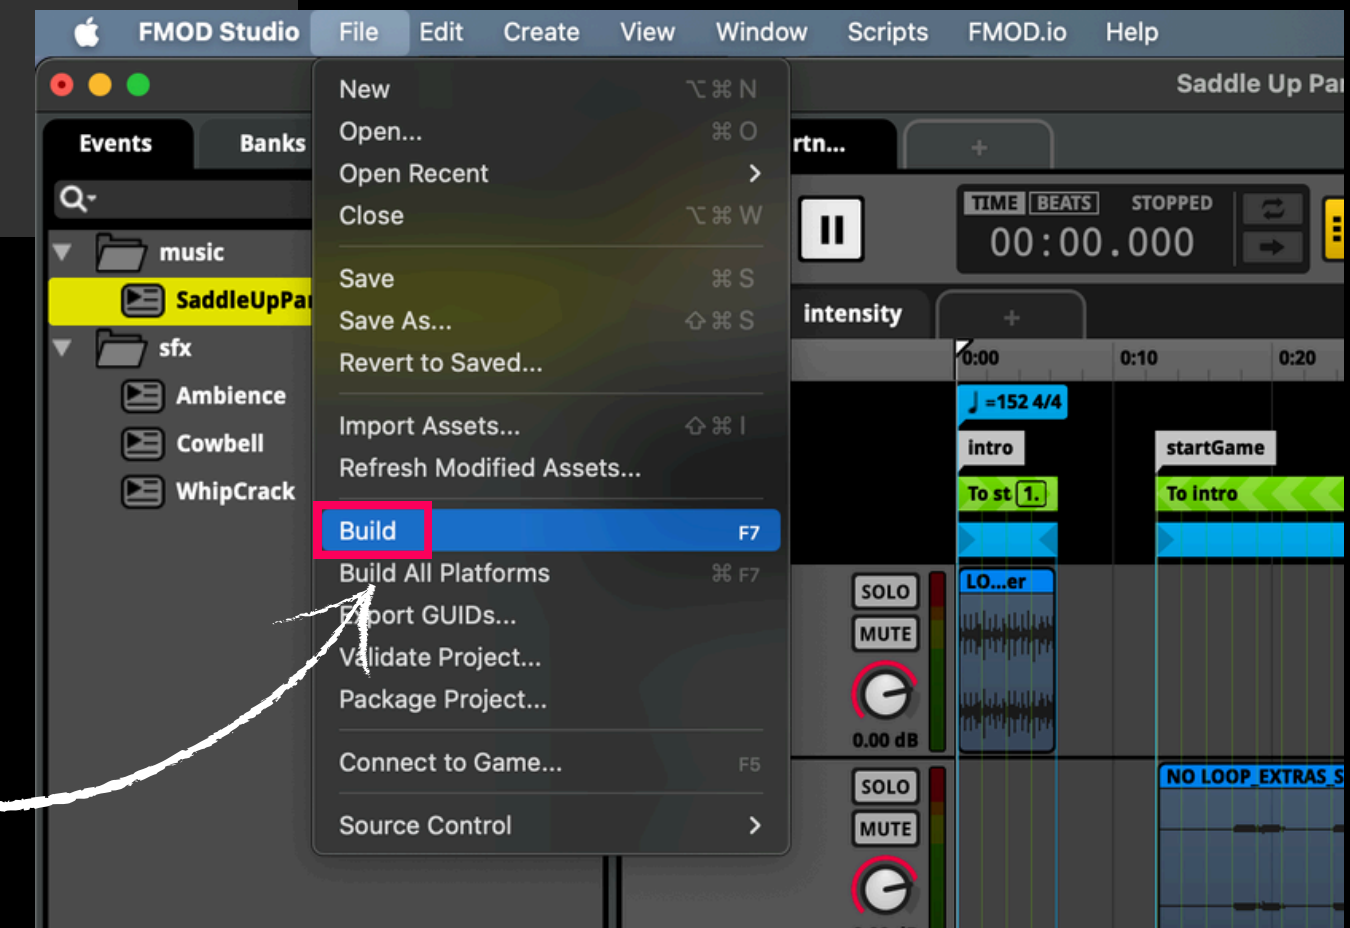

# 3) SETUP FMOD

- **Locate** the FMOD project file **Saddle Up Partner.fspro** in the **Implementation** folder
- **Open** the file in FMOD

Once open and loaded up, press **F7**,  
or select **Build** from the File menu

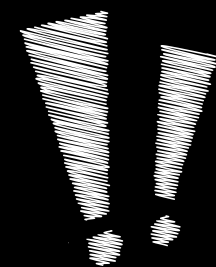

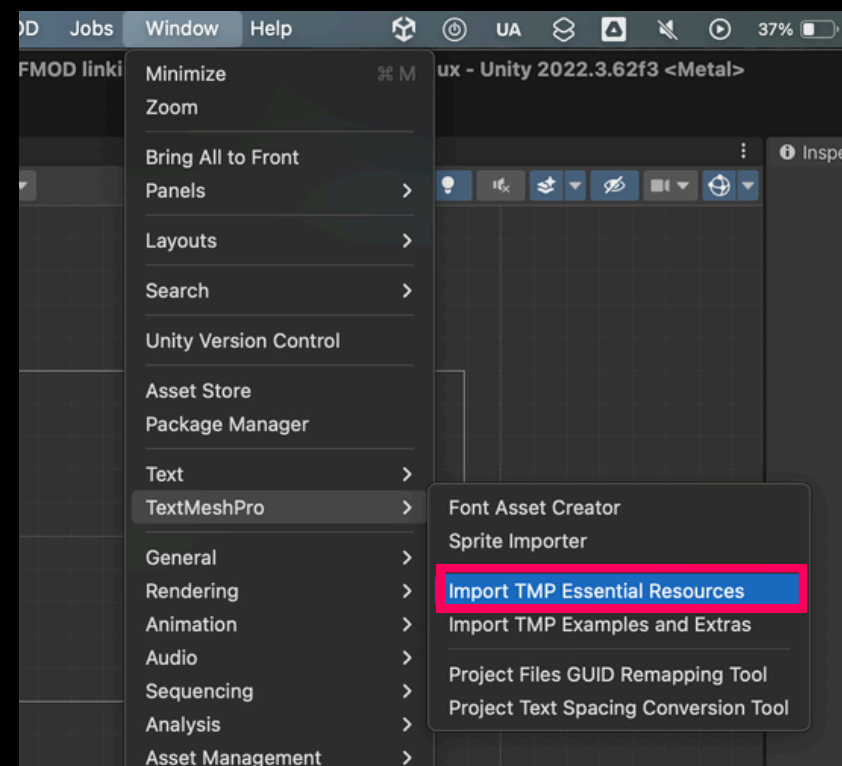

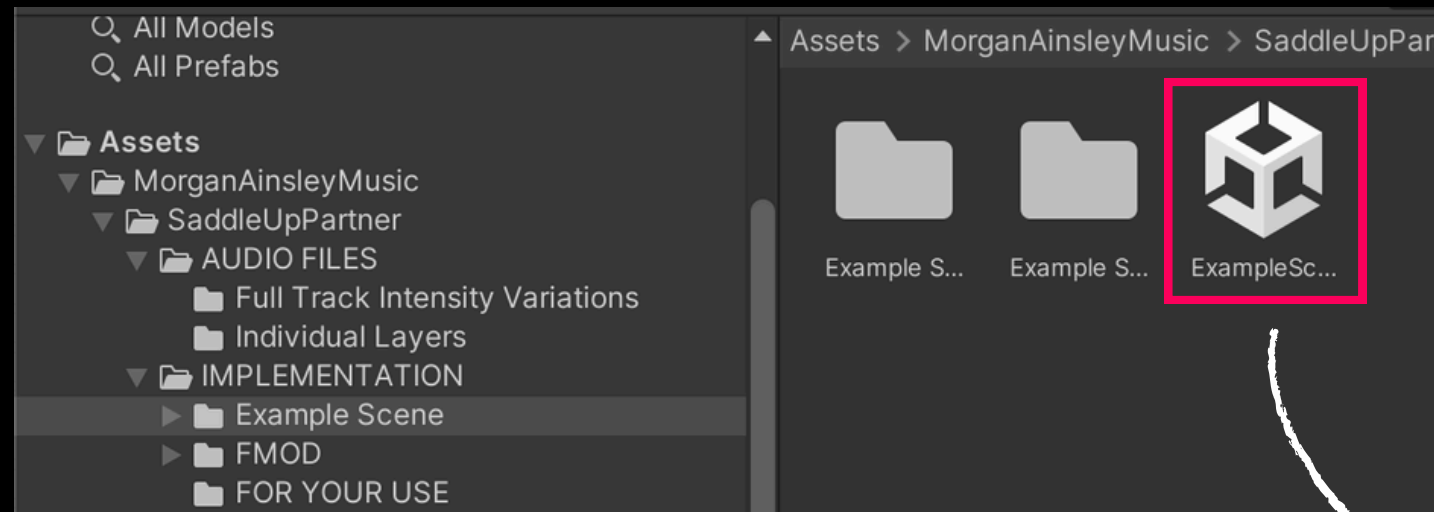

PART 2

**USING THE  
SYSTEM**

# EXAMPLE SCENE

Locate the **example scene**, open it up and **have a play!**

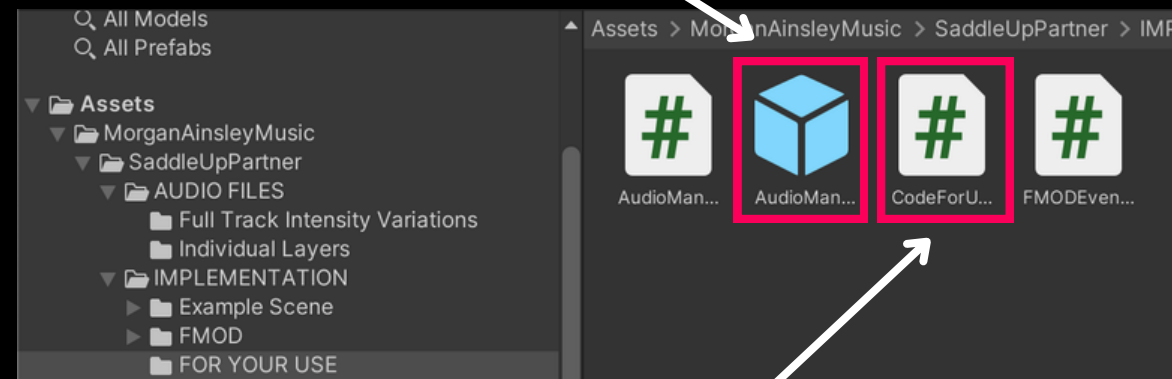

You'll need to import TMP Essentials  
for the example scene to work

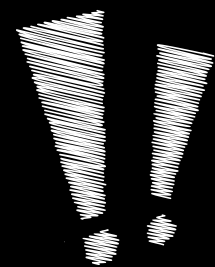

# YOUR GAME

Time to use the **audio system** in **your own game**!

- Drag the **AudioManager** prefab into your scene from the **FOR YOUR USE** folder.

- The **example script “CodeForUse”** has all the code you need to control the audio system from anywhere in your project. Just **copy and paste** whichever lines you need.

Make sure to include this namespace in your headers

```
using System.Collections;
using System.Collections.Generic;
using UnityEngine;
using UnityEngine.UI;
using MorganAinsleyMusic.SaddleUpPartner;
```

```
using System.Collections;
using System.Collections.Generic;
using UnityEngine;

No asset usages
public class SaddleUpExamples : MonoBehaviour
{
    void exampleCode()
    {
        //-----
        // The following are all the snippets of code you will need for
        // controlling the audio system from anywhere in your project.
        //-----

        //-----
        // Controlling gameplay mode
        //-----

        // Go from start screen into gameplay
        AudioManager.Instance.SetMusicParameter("gameActive", 1);

        // Go from gameplay back to main menu
        AudioManager.Instance.SetMusicParameter("gameActive", 0);
    }
}
```

There is code for:

- Changing between **menu** and **gameplay** state
- Entering and exiting **pause**
- Changing music **intensity** level
- **Stopping** and **restarting** music
- Playing a **sound effect**

```
// Stop the game music
//-----
AudioManager.Instance.StopMusic();

//-----
// Restart the game music (if not already playing)
//-----
AudioManager.Instance.RestartMusic();

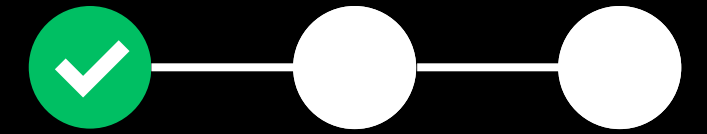

//-----
// Play a sound effect at a location
//-----
AudioManager.Instance.PlayOneShot(FMODEvents.Instance.ExampleSound, transform.position);
}
```

PART 3

**ADDING**

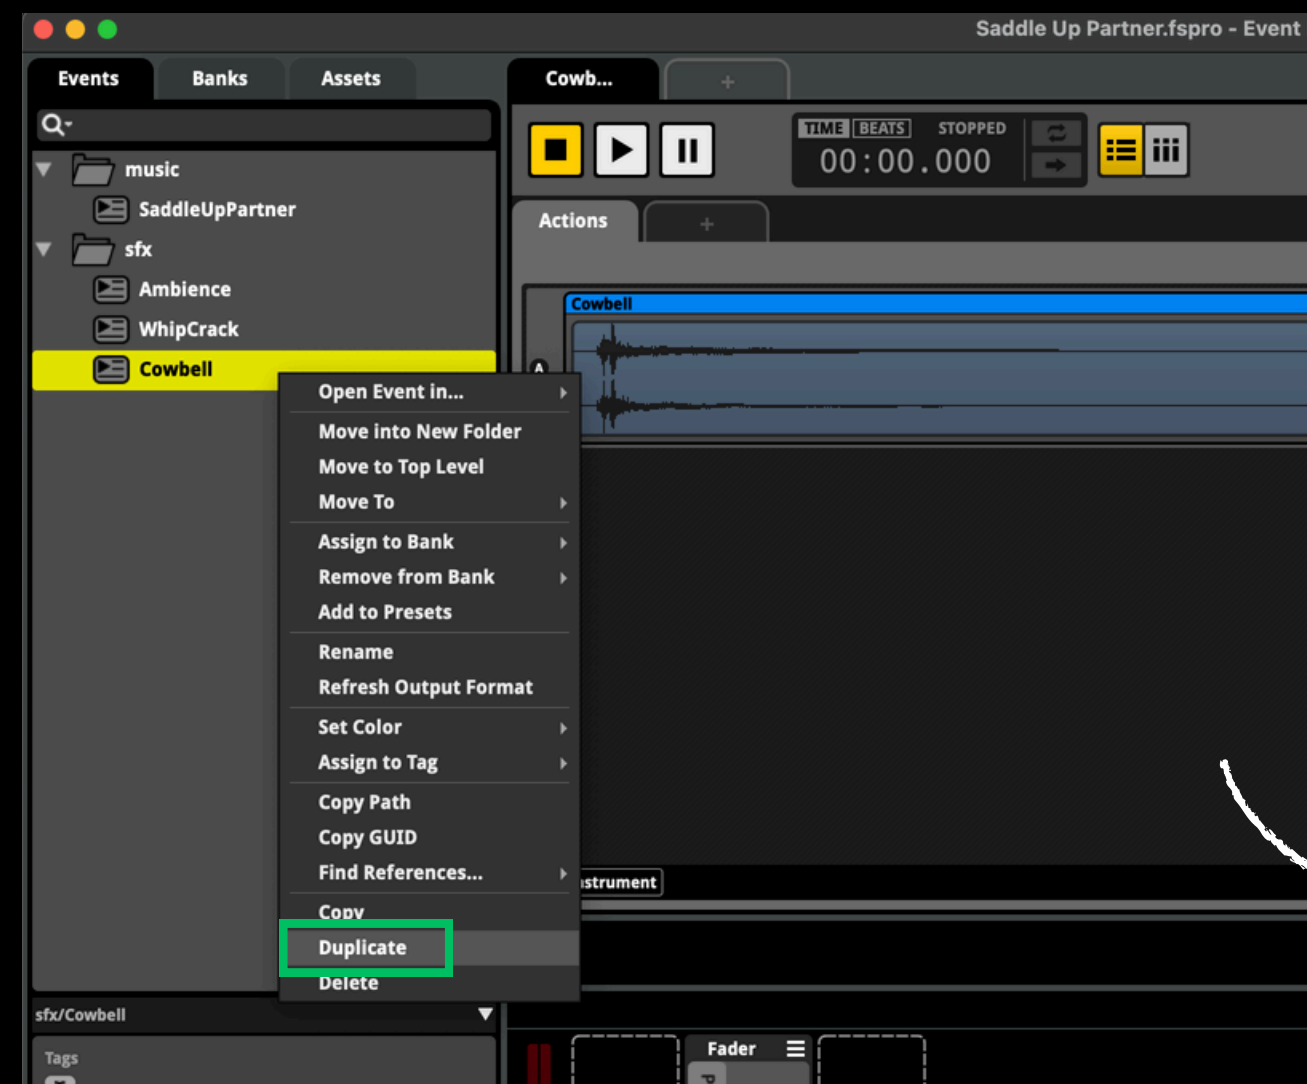

**EXTRA SFX**

# 1) ADD AUDIO IN FMOD

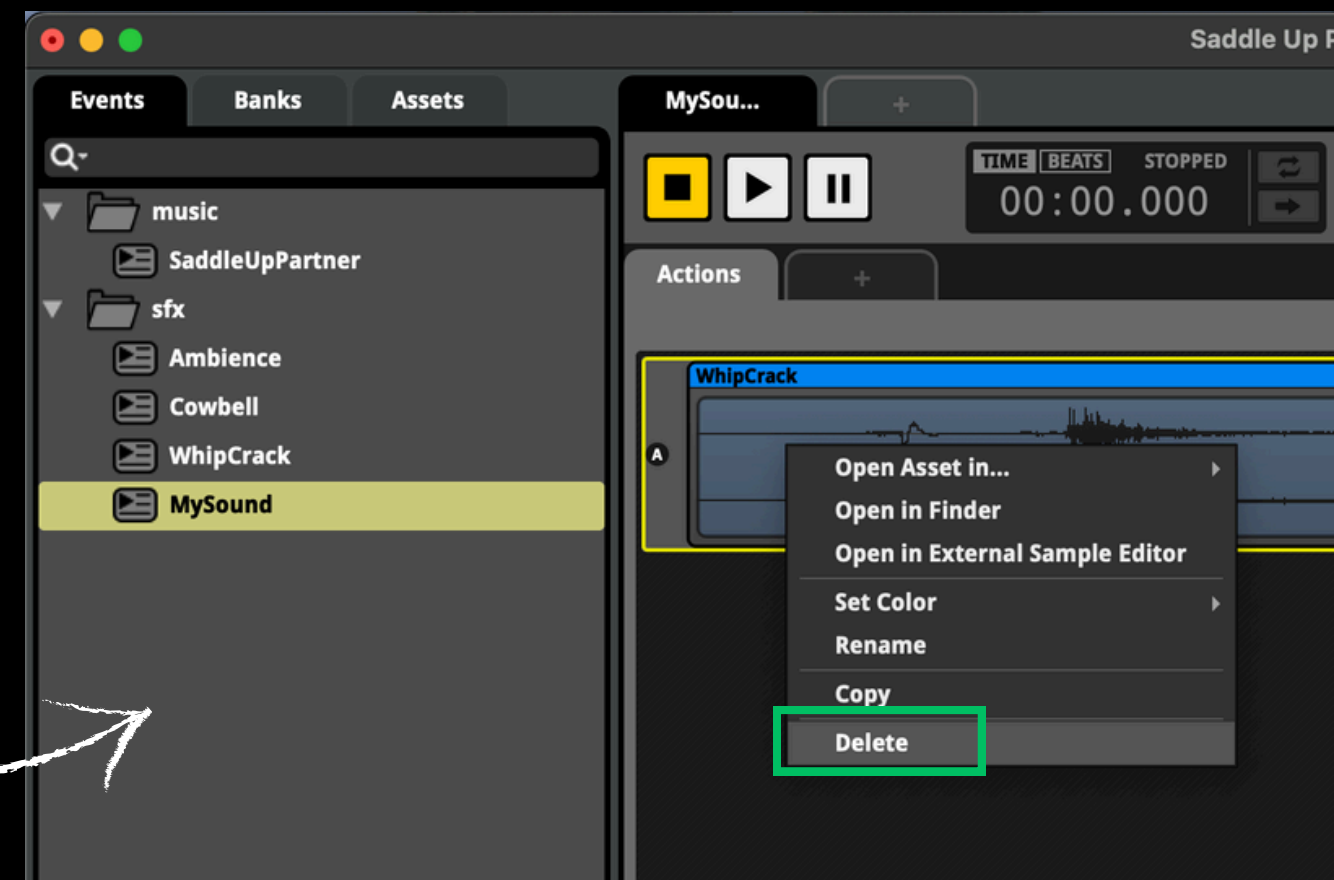

This project has **two example sound effects**, but you will need to add any additional sound effects for whatever is needed in your game **through FMOD**

- **Duplicate** one of the **example SFX** and **rename**

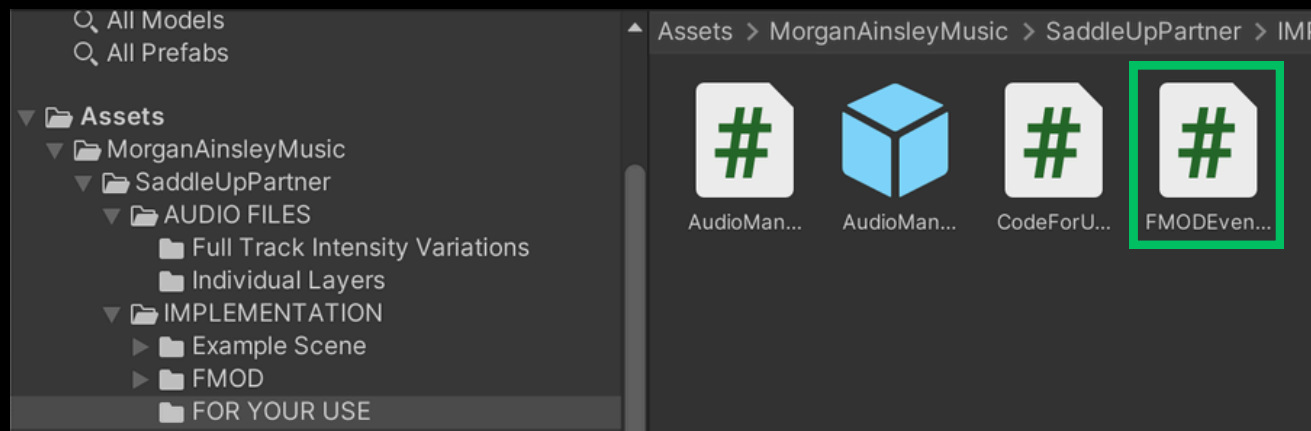

- **Delete** the audio file and **drag in your own sound**
- **Build** the project (press **F7** or find it in the menu like you did initially)

## 2) REFERENCE IN UNITY

- Open the **FMODEvents** script in the **FOR YOUR USE** folder

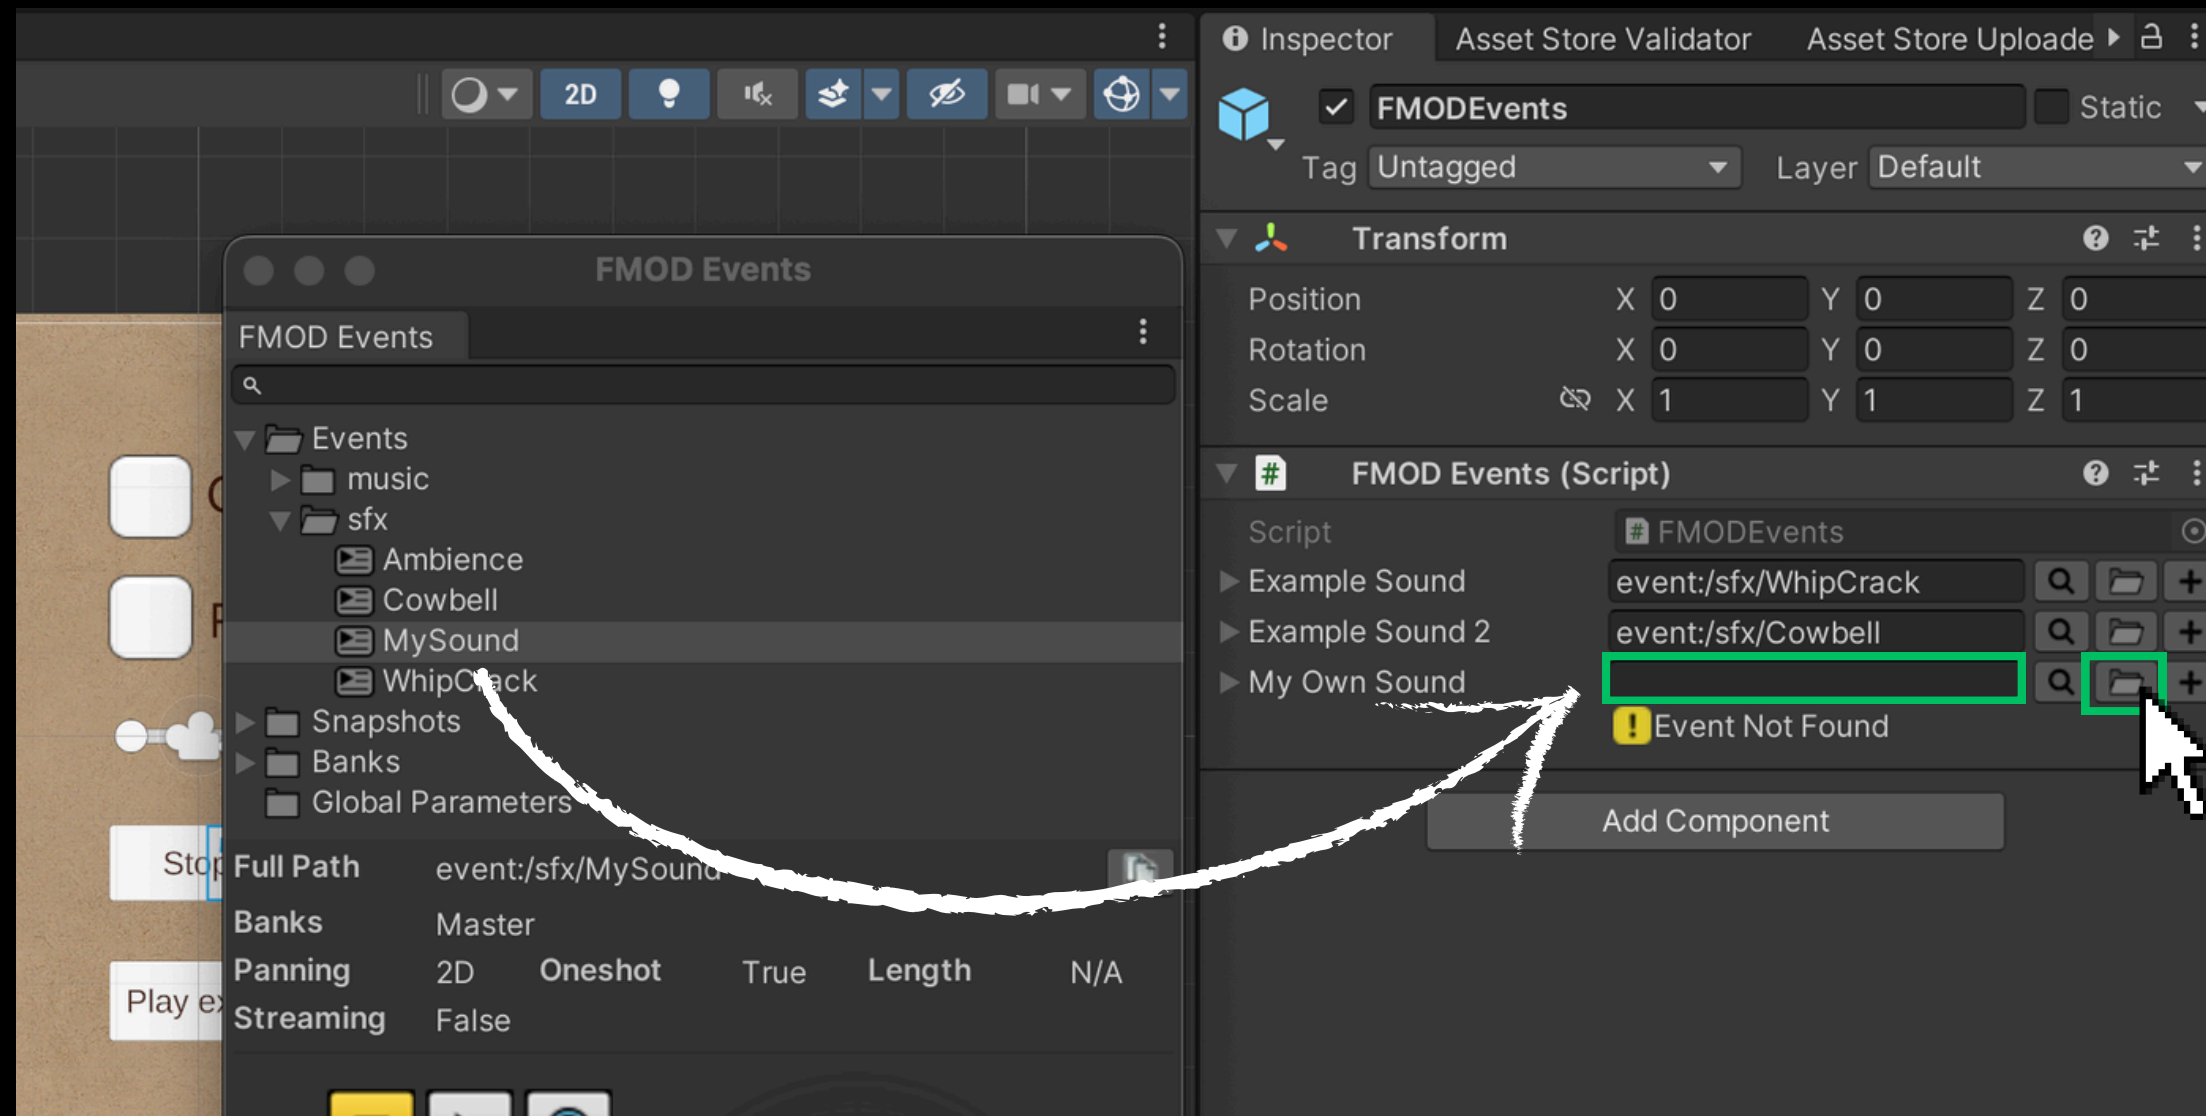

- Copy one of the **serialize field** lines and paste it directly below
- **Rename** for your own sound

```
using System.Collections.Generic;
using UnityEngine;
using FMODUnity;
using FMOD.Studio;

namespace MorganAinsleyMusic
{
    public class FMODEvents : MonoBehaviour
    {
        // -----
        // This creates the UI to select/drag in the FMOD file paths
        // for all your sounds. Just copy and paste this line and
        // rename for as many sounds as you need.
        // -----
        [field: SerializeField] public EventReference ExampleSound { get; private set; }
        [field: SerializeField] public EventReference ExampleSound2 { get; private set; }
        [field: SerializeField] public EventReference MyOwnSound { get; private set; }

        // This sets up the FMODEvents manager and ensures there is only one (singleton)
        public static FMODEvents Instance { get; private set; }
        private void Awake()
```

- On the **AudioManager** game object, select the child object called **FMODEvents**
- In the **inspector**, you'll see a new field has been created below the ones for **Example Sound** and **Example Sound 2**
- Click the **folder icon** next to your new field to open the **FMOD Events** browser, find your added sound and **drag** it into the field

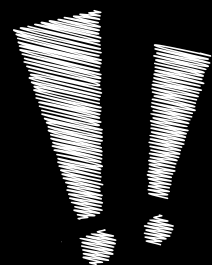

# 3) PLAY THE SOUND

- **Copy and paste** the **PlayOneshot** line of code from the **Code For Use** script into wherever you want to trigger that sound effect, making sure to replace **ExampleSound** with how you named your new sound in the **FMODEvents** script

```
//-----  
//  Play a sound effect at a location  
//-----  
AudioManager.Instance.PlayOneShot(FMODEvents.Instance.ExampleSound, transform.position);
```

Make sure to include this namespace in your headers

```
using System.Collections;  
using System.Collections.Generic;  
using UnityEngine;  
using UnityEngine.UI;  
using MorganAinsleyMusic.SaddleUpPartner;
```
